About Ball Screw

(1) High Reliability

.... has very stringent quality control standards covering every production process. With proper lubrication and use, trouble-free operation for an extended period of time is possible.

(2) Smooth Operation

The high efficiency of ball screws is vastly superior to conventional screws as shown in Fig. 1.1. The torque required is less than 30%. Linear motion can be easily changed from rotary motion.

Efficiency η_1 (%)

$\mu = 0.003$
$\mu = 0.005$
$\mu = 0.01$
Ball Screw
$\mu = 0.1$
$\mu = 0.2$

P = Force kgf
ℓ = Lead cm
η_1 = Efficiency

$$T = \frac{P \cdot \ell}{2 \pi \eta_2}$$

T = Torque kgf • cm
P = Force kgf
ℓ = Lead cm
η_2 = Efficiency

Fig. 1.1 Mechanical Efficiency of Ball Screws

(3) High Rigidity and Preload

When axial play is minimized in conventional screw-nut assemblies, the actuating torque becomes excessive and the operation is not smooth. The axial play in precision ball screws may be reduced to zero by preloading and a light smooth operation is still possible. Therefore, both low torque and high rigidity can be obtained simultaneously. ball screws have gothic arch groove profiles (Fig. 1.2) which allow these conditions to be achieved.

Fig. 1.2 Groove Shape of   Precision Ball Screw

(4)Circulation Method

Fig. 1.3 is ball return tube method.(T type、E type)
Fig. 1.4 is ball defelector method.(I type、K Type)
Fig. 1.3 Ball Return Tube method.
Fig. 1.4 Ball Deflector method

(5) High Durability

Rigidly selected materials, intensive heat treating and processing techniques, backed by years of experience, have resulted in the most durable ball screws manufactured. (As show Table 1.1and Fig. 1.5)

Table 1.1 Material and Heat Treatment

ITEM	MATERIAL	HEAT TREATMENT	HARDNESS

3.1 Accuracy

3.1.1 Lead/Travel Accuracy

● Lead accuracy of ball screws (grade C0~C5) is specified in 4 basic terms ($E, e, e_{300}, e_{2\pi}$). There are defined in Fig. 3.1 Tolerance of deviation ($\pm E$) and variation (e) of accumulated reference travel are shown in Table 3.2 and 3.3.

● Accumulated travel deviations for grade C7 and C10 are specified only by the allowable value per 300mm measured within any portion of the thread length. They are 0.05mm for C7 and 0.21mm for C10.

Fig. 3.1 Diagram of Lead Accuracy

Table 3.1 Definition of Terms for Lead Accuracy

Terms	Reference	Definition	Allowable
Travel Compensation	T	Travel compensation is the difference between specified and nominal travel within the useful travel. A slightly smaller value compared to the nominal travel is often selected by the customer to compensate for an expected elongation caused by temperature rise or external load. Therefore "T" is usually a negative value. Note : if no compensation is needed , specified travel is the same as nominal travel.	
Actual Travel		Actual travel is the axial displacement of the nut relative to the screw shaft.	
Mean Travel		Mean travel is the linear best fit line of actual. This could be obtained by the least squares method. This line represents the tendency of actual travel.	
Mean Travel Deviation	E	Mean travel deviation is the difference between mean travel and specified travel within travel length.	Table 3.2
Travel Variations	e e_{300} $e_{2\pi}$	Travel variations is the band of 2 lines drawn parallel to the mean travel , on the plus and minus side. Maximum width of variation over the travel length. Actual width of variation for the length of 300mm taken anywhere within the travel length. Wobble error , actual width of variation for one revolution (2π radian)	Table 3.2 Table 3.3 Table 3.3

3.1.3 Definition of Mounting Accuracy and Tolerances on Ball Screw

To use a ball screw properly dimensional accuracy and tolerances are most important.

will help you determine the tolerance factors as they are subject to change according to accuracy grade.

(1) Periphery run-out of the supporting part of the screw shaft to the screw groove.

(2) Concentricity of a mounting portion of the shaft to the adjacent ground portion of the screw shaft.

(3) Perpendicularity of the shoulders to the adjacent ground portion of the screw shaft.

(4) Perpendicularity of the nut flange to the axis of the screw shaft.

(5) Concentricity of the ball nut diameter to the screw groove.

(6) Parallelism of the mounting surface of a ball nut to the screw groove.

(7) Total run-out of the screw shaft to the axis of the screw shaft.

All ball screws are manufactured, inspected and guaranteed to be within specifications.
Fig. 3.2 Mounting Accuracy and Tolerances

3.1.4 Preload Torque

● Terms in relation to the preload torque generated during the rotation of the preload ball screws are shown in Fig. 3.3

● Permissible ranges of torque variation rates is shown in Table 3.5
Fig. 3.3 Descriptions of preload torque

Glossary

(1) **Preload**

The stress generated inside the screws when inserting a set of steel balls of one gage (approximately 2μ) larger into the nut or using them on the 2 nuts which exercise mutual displacements along the screws axis in order to eliminate the gaps of the screw or upgrade the rigidity of the screw.

(2) **Preload dynamic torque**

The dynamic torque required for continuously rotating the screws shaft or the nuts under unload condition after the specified preload has been applied upon the ball screws.

(3) **Reference**

The targeted preload dynamic torque〔Fig. 3.3〕-(1)

(4) **Torque variation values**

The variation values of the targeted preload torque variation rates are specified generally based on JIS Standards as indicated in Table 3.5.

(5) **Torque variation rate**

The rate of variation values in relation to the reference torque.

(6) **Actual torque**

The actually measured preload dynamic torque of the ball screws.

(7) **Average actual torque**

The arithmetic average of the maximal and minimal actual torque values measured when the nuts are exercising reciprocating movements.

(8) **Actual torque variation values**

The maximal variation values measured within the effective length of the threads when the nuts are exercising reciprocating movements, the positive or negative values relative to the actual torque are adopted.

(9) **Actual torque variation rate**

The rate of actual torque variation values in relation to the average actual torque.

Table 3.5 Permissible ranges of torque variation rates

Reference torque kgf·cm		Effective threading length (mm)										
		Below 4000								4000~10000		
		Slenderness 1：below 40				Slenderness 1:40 ~ 1:60				—		
		Grade				Grade				Grade		
Over	Incl.	C0	C1	C2、C3	C5	C0	C1	C2、C3	C5	C1	C2、C3	C5
2	4	±35 %	±40 %	±45 %	±55 %	±45 %	±45 %	±55 %	±65 %	—	—	—
4	6	±25 %	±30 %	±35 %	±45 %	±38 %	±38 %	±45 %	±50 %	—	—	—
6	10	±20 %	±25 %	±30 %	±35 %	±30 %	±30 %	±35 %	±40 %	—	±40 %	±45 %
10	25	±15 %	±20 %	±25 %	±30 %	±25 %	±25 %	±30 %	±35 %	—	±35 %	±40 %
25	63	±10 %	±15 %	±20 %	±25 %	±20 %	±20 %	±25 %	±30 %	—	±30 %	±35 %
63	100	—	—	±15 %	±20 %	—	—	±20 %	±25 %	—	±25 %	±30 %

Remarks 1.Slenderness is the value of dividing the screws shaft outside diameter with the
screws shaft threading length.
2.For reference torque less than 2 kgf·cm,   specifications will apply.

Calculation of reference torque Tp

The formula for computing reference torque of the ball screws is given in following:

$$Tp = 0.05 \, (\tan\beta)^{-0.5} \cdot \frac{Fao \cdot \ell}{2\pi}$$

Where，Fao：Preload（kf）

β：Lead angle

ℓ：Lead（cm）

Measurement conditions

The preload dynamic torque Tp is determined first by adopting the following measurement conditions together with the method illustrated in Fig. 3.4 for measuring the force F needed to rotate the screws shaft without bringing the nuts to rotate along with the shaft after the screws shaft has started rotating, then multiplying the measured value of F with the arm of force L, the product is Tp.

$$Tp=F \cdot L$$

Measure conditions
(1) Measurement is executed under the condition of not attaching with scraper.
(2) The rotating speed during measurement maintains at 100 rpm.
(3) According to JSK 2001 (industrial lubrication oil viscosity classification standards), the lubrication oil used should be in compliance with ISO VG68.
Fig. 3.4 Preload dynamic torque measuring method

3.2 Screw Shaft Design

3.2.1 Mounting Methods

- Both the critical speed and column bucking load depend upon the method of mounting and the unsupported length of the shaft,the most common mounting methods for ball screws are shown in Fig. 3.5~3.19.

Most Common Mounting Methods for ball Screws

The safety of the screw shaft against buckling needs to be checked when the shaft is expected to receive buckling loads. Fig. 3.20 shows a diagram which summarizes the allowable compressive load for buckling for each nominal outside diameter of screw shaft. (Calculate with the equation shown right when the nominal outside diameter of the screw shaft exceeds 125mm.)
Select the graduation of allowable axial load according to the method of ball screw support.
Remark: Allowable tensile / buckling load
Check the allowable tensile / buckling load (the formula shown below) and allowable load of the ball groove regardless of the mounting method when the mounting distance is short.

$$P = \sigma A = 11.8 dr^2 \ (kgf)$$

Where,

σ : Allowable tensile compressive stress (kgf / mm^2)
A : Sectional area (mm^2) of screw shaft root bottom diameter
dr : Screw shaft root diameter (mm)

$$P = \alpha \times \frac{N\pi^2 E}{L^2} = m \frac{dr^4}{L^2} \times 10^3$$

Where,

α : Safety Factor (0.5)
E : Vertical elastic modules $(E = 2.1 \times 10^4 \ kgf/mm^2)$
I : Min. secondary moment of screw shaft sectional area

$$I = \frac{\pi}{64} dr^4 (mm^4)$$

dr : Screw shaft root diameter (mm)
L : Mounting distance (mm)
m・N : Coefficient determined from mounting method of ball screw:

Simple－Simple m＝5.1 (N=1)
Fixed－Simple m＝10.2 (N=2)
Fixed－Fixed m＝20.3 (N=4)
Fixed－Free m＝1.3 (N=1/4)

Fig. 3.20 Buckling Load vs. Shaft Dia. and Length

It is necessary to check if the ball screw rotation speed is resonant with the natural frequency of the screw shaft.

has determined 80% or less of this critical speed as an allowable rotation speed. Fig. 3.21 shows a diagram which summarizes the allowable rotation speed for shaft nominal diameters up to outside diameter of the screw shaft exceeds 125mm.) Select the graduation of allowable rotation speed according to the method of supporting the ball screw. Where the working rotation speed presents a problem in terms of critical speed, it would be best to provide an intermediate support to increase the natural frequency of the screw shaft.

dm.n value

The allowable rotation speed is regulated also by the dm · n value (dm:diameter of central circle of steel ball , n:Revolution speed , rpm) which expresses the peripheral speed.
Generally;

For precision (accuracy grade C7 to C0)
$$dm \cdot n \leqq 70,000$$
For general industry (C10)
$$dm \cdot n \leqq 50,000$$

Product exceeding the above limits can be produced, contact *TBI MOTION*.

$$n = \alpha \times \frac{60\lambda^2}{2\pi L^2}\sqrt{\frac{E I g}{\gamma A}} = f\,\frac{dr}{L^2} \times 10^7 \ (rpm)$$

Where,

α : Safety factor （$\alpha = 0.8$）

E : Vertical elastic modules （$E = 2.1 \times 10^4\ kgf/mm^2$）

I : Min. secondary moment of screw shaft sectional area

$$I = \frac{\pi}{64}\,dr^4 (mm^4)$$

dr : Screw shaft root diameter （mm）

: Acceleration of gravity （ $= 9.8 \times 10^3\ mm/s^2$ ）

γ : Density （$\gamma = 7.8 \times 10^6\ kgf/mm^3$ ）

A : Screw shaft sectional area （$A = \pi\,dr^2/4\ mm^2$ ）

L : Mounting distance （mm）

$f \smallsetminus \lambda$: Coefficient determined from the ball screw mountung method

Simple－Simple $f = 9.7$ （$\lambda = \pi$）
Fixed－Simple $f = 15.1$ （$\pi = 3.927$）
Fixed－Fixed $f = 21.9$ （$\pi = 4.730$）
Fixed－Free $f = 3.4$ （$\pi = 1.875$）

(＊ Particular consideration is necessary for manufacturing when the screw length/shaft dia. Ratio is $\varepsilon > 70$. In such an event, contact *TBI MOTION*.)

Fig. 3.21 Critical Speed vs. Shaft Dia

3.3 Driving Torque

Driving torque T_S of the transmission shaft

$T_S = T_P + T_D + T_F$ （in fixed speed）

$T_S = T_G + T_P + T_D + T_F$ （when accelerating）

T_G：Acceleration torque （1）

T_P：Load torque （2）

T_D：Preload torque （3）

T_F：Friction torque （4）

（1） Acceleration T_G

$T_G = J\alpha$ （kgf・cm）

$\alpha = \dfrac{2\pi n}{60\triangle t}$ （rad/s^2）

J：Moment of inertia （kgf・cm・s^2）

α：Angular acceleration （rad/s^2）

n：Revolutions （min^{-1}）

$\triangle t$：Starting time （sec）

Fig. 3.22 Moment of inertia of load

【For reference】 Moment of inertia of load (Table 3.6)

$J = J_{BS} + J_{CU} + J_W + J_M$

J_{BS}：Moment of inertia Ball screws shaft

J_{CU}：Moment of inertia Coupler

J_W：Moment of inertia Linear motion part

J_M：Moment of inertia Roller shaft part of motor shaft

(2) Load torque T_P

$T_P = \dfrac{P\bullet\ell}{2\pi\eta_1}$ （kgf・cm）

$P = F + \mu M$

P：Axial load （kgf）

ℓ：Lead （cm）

η_1：Positive efficiency

↳ The efficiency when rotating motion is altered to linear motion

F：Cutting force （kgf）

μ：Friction coefficient

M：Mass of moving object （kg）

g：Acceleration of gravity （9.8 m/s^2）

$T_P = \dfrac{P\bullet\ell\bullet\eta_2}{2\pi}$

η_2：Reverse efficiency

↳ The efficiency when linear motion returns to rotating motion

(3) Preload torque T_D

$T_D = \dfrac{K\bullet P_{PL}\bullet\ell}{\sqrt{\tan\alpha}\bullet 2\pi}$ （kgf・cm）

K：Internal coefficient (0.05 is usually adopted)

P_{PL}：Preload kgf）

ℓ：Lead （cm）

α：Lead angle

(4) Friction torque T_F

$T_F = T_B + T_O + T_J$ (kgf・cm)

T_B：Friction torque of bracing shaft

T_O：Friction torque of free shaft

T_J：Friction torque motor shaft

The friction torque of the bracing shaft would be affected by the lubrication oil. Or special attention has to be paid to unexpected excessive friction torque which may be generated when oil seal is overly tight, or may result in temperature rise.

Table 3.6 Conversion formula for moment of inertia of load

Moment of inertia converted from motor shaft / Formula	J
Cylinder load	$\dfrac{\pi \rho L D^4}{32}$
Linearly moving object	$\dfrac{M}{4}\left(\dfrac{V\ell}{\pi \cdot N_M}\right)^2 = \dfrac{M}{4}\left(\dfrac{P}{\pi}\right)^2$
Unit	$kg \cdot m^2$
Moment of inertia during deceleration	$J_M = \left(\dfrac{J\ell}{N_M}\right)^2 \cdot J\ell$

ρ : Density (kg / m^3) $\rho = 7.8 \times 10^3$

L : Cylinder length (m)

D : Cylinder diameter (m)

M : Mass of the linear motion part (kg)

Vℓ : Velocity of the linearly moving object (m / min)

N$_M$: Motor shaft revolutions (min^{-1})

P : The moving magnitude of the linearly moving object per every rotation of the motor (m)

Nℓ : Rotations in longitudinal moving direction (min^{-1})

Jℓ : Moment of inertia in load direction

J$_M$: Moment of inertia in motor direction

3.4 Nut Design

3.4.1 Selection of Nut

（1） Series

When making selection of series, please take into consideration of demanded accuracy, intended delivery time, dimensions(the outside diameter of the screw, ratio of lead / the outside diameter of the screw), preload load, etc.

（2） Circulation type

Selection of circulation type : Please focus on the economy of space for the nut installation portion.

(a)External circulation type

- Economy
- Suitable for mass production
- Applicable to those with larger lead / the outside diameter of the screw

(b) Internal circulation type

- With nuts of finely crafted outside diameter (occupying small space)
- Applicable to those with smaller lead / the outside diameter of the screw

(c)End-caps circulation type

- Suitable for high speed positioning
- Suitable for high basic rating load (proprietary nut)

（3） Number of loop circuits

Performance and life of service should be considered when selecting number of loop circuits

（4） Shape of flanges

Please make selection based on the available space for the installation of nuts.

（5） Oil hole

Oil holes are provided for the precision ball screws, please use them during machine assembling and regular furnishing.

Nut Types

● **S - type nut**

The steel balls of this type of nut forward along the groove between the screw and nut, and recycle through the circulators on both sides. The circulation way is similar with E type. Hence, this way is the design of the circulation of the steel ball along the direction of tangent of helix, and there are sound-insulated and dust-free apparatuses on both sides of nut so the noise volume will be diminished. In addition, the assembly space is small so the S type nut is suitable for the high-speed and light-load situations specially. (as per Fig. 3.23).
Fig. 3.23 S-type nut

● **V- type nut**

The recycle way of V-type is similar with T-type. Besides maintaining the advantages of T-type, the design of circulation of the steel ball is also along the direction of tangent of helix and can decrease the sound caused from the hitting between steel ball and the part of guided part and increase the smooth of recycle. V-type nut is suitable for the high-speed and heavy-load situations specially. (as per Fig. 3.24).
Fig. 3.24 V-type nut

● **T - type nut**

For the circulation of this type, the steel balls roll forward along the grooves between the screws and the nut, then are picked up at the front end of the external circulation tube, which further pass through the circulation tube and circle around to the other end of the circulation tube, finally return to the origin point (as per Fig. 3.25).

It is generally provided with several rolls of steel balls and a single pass circulation tube, both round type and projecting tube type of profile may be adopted.
Fig. 3.25 T- type nut

● **U.I - type nut**

In this type, the steel balls move along the grooves of the internal circulator, diagonally pass over the tooth tops of the screws, then return to the origin point. It generally possesses one roll of steel balls and one single pass circulation (as per Diagram 3.26)

This type of screws has at least one end with completely through threading, suitable for screws of smaller diameters, it is equipped with metal circulator.
Fig. 3.26 U.I - type nut
Fig. 3.27 K- type nut

● K **- type nut**

It applies the similar circulation as that of I-type,but circulation takes place in key slots of identical angle for different circulation (as per Fig. 3.27)
Fig. 3.28 E- type nut

● E **- type nut**

This type has the features of both the external circulation type and the internal circulation type; the steel balls roll forward in the grooves between the screw and the nut, and are further guided by the end cap circulator at the nut end to the circulating hole in the nut body. It is generally similar to the external circulation type featuring multiple rolls of steel balls and single pass of circulation, but is not provided with external tubes (as per Fig. 3.28).

3.5 Rigidity

Excessively weak rigidity of the screw's peripheral structure is one of the primary causes that result in lost motion. Therefore in order to achieve excellent positioning accuracy for the precision machines such as NC working machines, etc., axial rigidity balance as well as torsional rigidity for the parts at various portions of the transmission screw have to be taken into consideration at time of designing.

Static Rigidity K

The axial elastic deformation and rigidity of the transmission screw system can be determined from the formula below.

$$K = \frac{P}{e} \ (kgf / mm)$$

P : Axial load (kgf) borne by the transmission screw system

e : Axial flexural displacement (mm)

$$\frac{1}{K} = \frac{1}{K_S} + \frac{1}{K_N} + \frac{1}{K_B} + \frac{1}{K_H} \ (mm / kgf)$$

K_S : Axial rigidity of screw shaft (1)

K_N : Axial rigidity of nut (2)

K_B : Axial rigidity of bracing shaft (3)

K_H : Axial rigidity of installation portions of nuts and bearings (4)

(1) Axial rigidity K_S and displacement δ_S of screw shaft

$$K_S = \frac{P}{\delta_S} \ (kgf / mm)$$

P : Axial load (kgf)

For places of Fixed − Fixed installation

$$\delta_{SF} = \frac{PL}{4AE} \ (mm)$$

For places other than Fixed − Fixed installation

$$\delta_{SS} = \frac{PL_o}{4AE} \ (mm)$$

$$\delta_{SS} = 4\delta_{SF}$$

δ_{SF} : Directional displacement at places of fixed-fixed installation

δ_{SS} : Directional displacement at places other than fixed-fixed installation

A : Cross-sectional area of the screw shaft tooth root diameter (mm^2)

E : Longitudinal elastic modulus (2.1×10^4 kgf /mm^2)

L : Distance between installations (mm)

L_o : Distance between load applying points (mm)

(2) Axial rigidity K_N and displacement δ_N of nut

$$K_N = \frac{P}{\delta_S} \ (kgf / mm)$$

(a) In case of single nut

$$\delta_{NS} = \frac{K}{\sin\beta} \left(\frac{Q^2}{d}\right)^{1/3} \times \frac{1}{\zeta} \ (mm)$$

$$Q = \frac{P}{n \cdot \sin\beta} \ (kgf)$$

$$n = \frac{D_0 \pi m}{d} \ (each)$$

Q : Load of one steel ball (kgf)

n : Number of steel ball

k : Constant determined based on material, shape, dimensions $k \fallingdotseq 5.7 \times 10^{-4}$

β : Angle of contact (45°)

P : Axial load (kgf)

d : Steel ball diameter (mm)

ζ : Accuracy, internal structure coefficient

m : Effective number of balls

D_0 : Steel ball center diameter (mm)

$$D_0 = \frac{\ell}{\tan\alpha \cdot \pi}$$

ℓ : Lead (mm)

α : Lead angle

(b) In case of double nuts
Fig. 3.29 Preloaded for the double nuts

When an axial load P of approximately 3 times of the preload load P_{PL} is exerted, for the purpose of eliminating the preload P_{PL} on nut B, please set the preload load P_{PL} at no more than 1/3 of the maximal axial load (0.25Ca should be taken as the standard maximal preload load). With respect to the displacement value, it should be of 1/2 of the single nut displacement when axial load is 3 times of the preload.

$$K_N = \frac{P}{\delta_{NW}} = \frac{3P_{PL}}{\delta_{NS}/2} = \frac{6P_{PL}}{\delta_{NS}} \ (kgf\,/\,mm)$$

δ_{NS} : Displacement of single nut (mm)

δ_{NW} : Displacement of double nuts (mm)

(Explanation of the rigidity of double nuts)

As shown in Diagram 3.29 and 3.30, when a preload P_{PL} is applied on the 2 nuts A,B, both nuts A & B would produce flexural deformations that will reach point X. If an external force P is exerted from here, nut A would move from point X to point X1, while nut B would move from X to X2.

Then, based on the computing formula for displacement δ_{NS} of the single nut, we can obtain:

$$\delta_0 = aP_{PL}^{2/3}$$

while displacements of nuts A & B are

$$\delta_A = aP_{PL}^{2/3}$$

since displacements of nuts A & B generated due to exertion of external force P are equal, therefore

$$\delta_A - \delta_0 = \delta_0 - \delta_B$$

or if P is the only external force P that exerts on nuts A,B, if P_A increases

$$P_A - P_B = P$$

$$\delta_B = 0$$

for preventing the external force applied on nut B being absorbed by nut A thus decreasing, so

when $\delta_B = 0$

$$aP_A^{2/3} - aP_{PL}^{2/3} = aP_{PL}^{2/3}$$

$$P_A^{2/3} = 2P_{PL}^{2/3}$$

$$P_A = \sqrt{8}\,P_{PL} \doteqdot 3P_{PL}$$

or based on $\delta_A - \delta_0 = \delta_0$

$$\delta_0 = \frac{\delta_A}{2}$$

thus it can also be judged from Fig. 3.31 that, when axial load is 3 times of preload load , for a single nut with 1/2 displacement, the rigidity is 2 times as high.
Fig. 3.30
Fig. 3.31

(3) Axial rigidity K_B and displacement δ_B of bracing shaft

$$K_B = \frac{P}{\delta_B} \ (kgf\,/\,mm)$$

The rigidity of the assembled diagonal thrust ball bearing that is used as the bracing bearing for the ball screw and is widely utilized in the field of precision machines can be found from the following formula.

$$\delta_B = \frac{2}{\sin\beta} \left(\frac{Q^2}{d} \right)^{1/3}$$

$$Q = \frac{P}{n \cdot \sin\beta} \ (kgf)$$

Q : Load of one steel ball (kgf)

β : Angle of contact (45°)

d : Steel ball diameter (mm)

P : Axial load (kgf)

n : Number of steel balls

(4) Axial rigidity K_H and displacement δ_H of installation portions of nuts and bearings.

In early stage of machine development, special attentions should be paid to the requirement of high rigidity for the installation portion.

$$K_H = \frac{P}{\delta_H} \ (kgf\,/\,mm)$$

3.6 Positioning Accuracy

Among the factors that cause feed accuracy errors, lead stroke accuracy and feed system rigidity are the key points for review, while other factors such as heat deformation due to temperature rise as well as assembly accuracy for the guiding surface, etc. should also be taken into consideration.

3.6.1 Accuracy Selection

Table 3.7 shows the recommended application ranges for various ball screws accuracy classes based on different.

Table 3.7 Examples of ball screws accuracy classes for different uses

Thermal displacement of the screw shaft results in deterioration of the positioning accuracy. The magnitude of the thermal displacement is calculated as follows:

$$\Delta \ell = \alpha \cdot t \cdot L \ (mm)$$

$\Delta \ell$: Thermal displacement (mm)

  t : Temperature rise (deg) at screw shaft

  L : Screw shaft length (mm)

  α : Coefficient of thermal expansion $(11.7 \times 10^{-6} \ deg^{-1})$

Namely, the screw shaft develops elongation of 12 μ m per 1m when the temperature rises by 1℃. The ball screw, which lead has been machined to high accuracy, may fail to meet highlevel requirements because of the thermal displacement due to temperature rise. As the ball screw is operated at higher speeds, the heat generation grows to increase the influence of temperature rise.

The thermal displacement countermeasures for ball screws include the following:

(1) Control of heat generation
- Optimization of preload
- Correct selection and supply of lubricant
- Increase in ball screw lead, with reduced rotation speed

(2) Forced cooling
- Hollow screw shaft to allow cooling fluid to flow through
- Cooling of screw shaft exterior with cooling oil or air

(3) Avoid influence of temperature rise
- High-speed warming up for use in a temperature stabilized size
- Pre-tension of screw shaft
- Negative travel compensation of cumulative lead
- Use of closed loop

3.7 Life Design

3.7.1 Life of Ball Screws

Even the ball screw is used under correct conditions, it would still fail after a period of time due to deterioration. The elapse of time until it is out of service is called the service life of the screw, which is generally classified into the fatigue life when delamination phenomenon occurs and the accuracy deterioration life caused by wear-out, etc.

3.7.2 Basic Static Load Rating Coa

The basic load rating is an axial static load which will produce a permanent combines deformation at contact points of the balls to ball grooves equal to 0.01% of the ball diameter.

3.7.3 Basic Dynamic Load Rating Ca

The basic dynamic load rating is an axial load which allows 90% of a group of identical ball screws (rotated under the same condition) to rotate without flaking for 1 million revolutions. This basic dynamic load rating is shown in the table of dimensions

Relation between load and service life

$$L \propto \left(\frac{1}{P} \right)^3$$

L : Service life
P : Load

3.7.4 Fatigue Life

Table 3.8

Usage	Life in hours（h）
Working machines	2 0 0 0 0
General industrial machines	1 0 0 0 0
Automatic control machines	1 5 0 0 0
Measurement machines	1 5 0 0 0

Average load P_e

（1）When axial load keeps changing from time to time, please calculate in order to find out the average load for the equivalent fatigue life under different load condition changes (as Diagram 3.32).

$$P_e = \left(\frac{P_1^3 n_1 t_1 + P_2^3 n_2 t_2 + \dots + P_n^3 n_n t_n}{n_1 t_1 + n_2 t_2 + \dots + n_n t_n} \right)^{1/3} \quad (kgf)$$

Axial Load （kgf）	Rotating Speed （min^{-1}）	Time （%）
P_1	n_1	t_1
P_2	n_2	t_2
⋮	⋮	⋮
⋮	⋮	⋮
P_n	n_n	t_n

But , $t_1 + t_2 + t_3 + \dots + t_n = 100$

Fig. 3.32

$$P_e = \frac{2P_{max} + P_{min}}{3} \quad (kgf)$$
P_{max}：Maximal axial load （kgf）

P_{min}：Minimal axial load （kgf）

（2）When load changes according to sine curve (Fig. 3.33)

$P_e \fallingdotseq 0.65 P_{max}$ （ Fig. A ）

$P_e \fallingdotseq 0.75 P_{min}$ （ Fig. B ）
Fig. 3.33

Calculation of Life

The fatigue life is generally expressed by the total number of revolutions. The total rotation hours or total travel distance may also be used to express life. The fatigue life is calculated as follows:

$$L = \left(\frac{Ca}{Pa \cdot fw} \right)^3 \cdot 10^6$$

$$L_t = \frac{L}{60n}$$

$$L_s = \frac{L \cdot \ell}{10^6}$$

Where

L：Rated fatigue life （rev）　　L_t：Life in hours （h）

L_s：Life in travel distance （Km）　C_a：Basic dynamic load rating （kgf）

P_a：Axia （kgf）

f_w：Load factor (Factor depending on operation conditions)　n：Rotating speed （rpm）

ℓ：Lead （mm）

Smooth operation without impact . . . . 1.0～1.2

Normal operation . . . . 1.2～1.5

Operation with impact and vibration . . . . 1.5～3.0

Basic Dynamic Load Rating C_a

$C_a = P_e \cdot f_s$
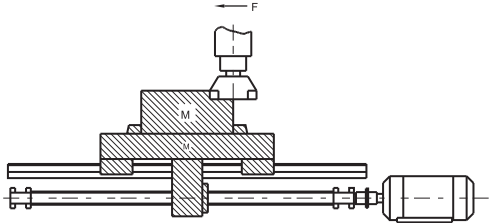

Basic Static Load Rating C_{oa}

$C_{oa} = P_{max} \cdot f_s$

Table 3.9 Factor of safety (fs)
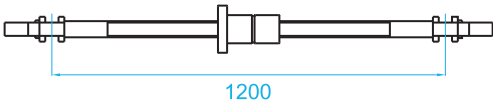

Usage	Operation	fs
Industrial machines	Normal operation	1.0～1.3
	Operation with impact and vibration	2.0～3.0
Working machines	Normal operation	1.0～1.5
	Operation with impact and vibration	2.5～7.0

Key Points for Ball Screw Selection and Calculation

Key points for ball screws selection	Calculation for ball screws selection

When ball screws are subjected to selection, it is a most fundamental rule that you must first clearly find out what the operation conditions are before going ahead with the final design. Moreover, the elements of your selection include load weight, stroke, torque, position determination accuracy, tracking motion, hardness, lead stroke, nut inside diameter, etc., all elements are mutually related, any change to one of the elements will lead to the changes of other elements, special attention should always be paid to the balance among the elements.

Design conditions

1. Working table weight 300 Kg
2. Working object weight 400 Kg
3. Maxima 700 mm
4. Fast feed speed 10 m/min
5. Minimal disassembly ability 10 μm/stroke
6. Driving motor DC motor （MAX 1000 min^{-1}）
7. Guiding surface friction coefficient （μ= 0.05～0.1）
8. Running rate 60％
9. Accuracy review items
10. Inertia generated during acceleration/deceleration can be neglected because the time periods involved are comparatively small.

1.Setting of operation conditions

(a) Machine service life time reckonig of H (hr)

H = ☐ × ☐ × ☐ × ☐

hours/day days/ year life years Running

(b) Mechanical conditions

Calculation Date / Difference Operations	Speed/rotations	Cutting resistance	Sliding resistance	Time used
Fast feed	m / min / min^{-1}	kgf	kgf	%
Light cutting	/			
Medium cutting	/			
Heavy cutting	/			

(c) Position determination accuracy
Feed accuracy error factor includes load accuracy and system rigidity.Thermal displacement due to heat generation and positional error of the guide system is also important factors.

1.Setting of operation conditions

(a) Machine service life time reckonig of H (hr)

H = 12 hrs×250 days×10 years×0.6 Running
=18000hr

(b) Mechanical conditions

Calculation Date / Difference Operations	Speed/rotations	Cutting resistance	Sliding resistance	Time used
Fast feed	10m/min/1000min^{-1}	0 kgf	70 kgf	10％
Light cutting	6 / 600	100	70	50
Medium cutting	2 / 200	200	70	30
Heavy cutting	1 / 100	300	70	10

Sliding resistance = (300+400) × 0.1＝70 kgf

Key points for ball screws selection	Calculation for ball screws selection
2. Ball screws lead stroke ℓ (mm) $\ell = \dfrac{\text{Fast feed stroke (m/min)} \times 1000}{\text{Max. Rotating speed (min}^{-1}) \text{ of motor}}$ (mm)	2. Ball screws lead stroke ℓ (mm) $\ell = \dfrac{10000}{1000} = 10$ (mm) Minimal disassembly $= \dfrac{10mm}{1000 \text{ stroke}} = 0.01$ mm/stroke
3. Computation of average load Pe (kgf) $Pe = \left(\dfrac{P_1^3 n_1 t_1 + P_2^3 n_2 t_2 + \cdots + P_n^3 n_n t_n}{n_1 t_1 + n_2 t_2 + \cdots + n_n t_n} \right)^{1/3}$ $Pe = \dfrac{2Pmax + Pmin}{3}$ $pe \doteq 0.65 Pmax$ $pe \doteq 0.75 Pmin$	3. Computation of average load Pe (kgf) $Pe =$ $\left(\dfrac{70^3 \times 1000 \times 10 + 170^3 \times 600 \times 50 + 270^3 \times 200 \times 30 + 370^3 \times 100 \times 10}{1000 \times 10 + 600 \times 50 + 200 \times 30 + 100 \times 10} \right)^{1/3}$ $\doteq 189$ kgf
4. Average number of rotations n_m $n_m = \dfrac{n_1 t_1 + n_2 t_2 + \cdots + n_n t_n}{100}$	4. Average number of rotations n_m $n_m = \dfrac{1000 \times 10 + 600 \times 50 + 200 \times 30 + 100 \times 10}{100}$ $= \dfrac{4.7 \times 10^4}{100}$ $= 470$ min^{-1}
5. Calculation of required dynamic rated load Ca $Ca = Pe \cdot fs$	5. Calculation of required dynamic rated load Ca $Ca = 189 \times 5 = 945$ (kgf)
6. Calculation of required static rated load Coa $Coa = Pmax \cdot fs$	6. Calculation of required static rated load Coa $Coa = 369 \times 5 = 1845$ (kgf)
7. Selection of nut type $Ca > 945 \quad Coa > 1845$ Select the nut types with basic dynamic rated load and basic static rated load as specified above.	7. Selection of nut type Choose SF I 4010 on the catalogue $Ca = 3178$ kgf $Coa = 9480$ kgf

Key points for ball screws selection	Calculation for ball screws selection
8. Calculation of life confirmation Lt (h) $$L_t = \left(\frac{Ca}{Pe \cdot fw} \right)^3 \cdot \frac{1}{60 n_m} \cdot 10^6$$	8. Calculation of life confirmation Lt (h) $$L_t = \left(\frac{3178}{189 \cdot 2} \right)^3 \cdot \frac{1}{60 \cdot 470} \cdot 10^6$$ $$= 20479 \text{ (h)}$$
9. Determination of screw length Screw length = Maximal stroke + Nut length + $\qquad$ 2 × reserved length at shaft end	9. Determination of screw length Screw length = 700+93+2×81 $\qquad$ = 874 mm
10. Mounting distance of screw length	10. Mounting distance of screw length(F-F support) 1200
11. Permissible axial load	11. Permissible axial load $\qquad$ Omitted because of F-F support
12. Permissible revolution speed n and dm $$n = \alpha \times \frac{60 \lambda^2}{2 \pi L^2} \sqrt{\frac{EIg}{\gamma A}} = f \frac{dr}{L^2} \times 10^7 \ (rpm)$$ dm = Shaft dia. × Maximal speed	12. Permissible revolution speed n and dm $$n = \frac{21.9 \times 35.2 \times 10^7}{1200^2}$$ $$= 5353 \text{min}^{-1} > \text{nmax}$$ $$dm = 40 \times 1000$$ $$= 40000 < 50000$$
13. Countermeasure against thermal displacement and rigidity	13. Countermeasure against thermal displacement and rigidity （a）It is estimated there would be a temperature rise of 2~5℃ with the ball screws of the general machinery, take temperature rise of 2℃ to computer the extension of ball screw. $$\Delta \ell = \alpha \cdot t \cdot L$$ $$= 11.7 \times 10^{-6} \times 2 \times 700 \text{ mm} \doteqdot 0.016 \text{ mm}$$ $$F_P = \frac{EA \Delta \ell}{L}$$ $$= \frac{2.06 \times 10^4 \times \frac{\pi \times 35.2^2}{4} \times 0.016}{700} \doteqdot 458 \text{ kgf}$$

Key points for ball screws selection	Calculation for ball screws selection

Key points for ball screws selection

(Reference) Force exerted on ball screw when inertia is considered

◎ When used horizontally

1．During acceleration

$$P_{ACC} = Mg \times \mu + \frac{M \times V}{60 \times \Delta t}$$

2．During deceleration

$$P_{DEC} = Mg \times \mu - \frac{M \times V}{60 \times \Delta t}$$

◎ When used vertically

1．During acceleration while descending, during deceleration while ascending

$$P_U = Mg - \frac{M \times V}{60 \times \Delta t}$$

2．During acceleration while ascending, during deceleration while descending

$$P_D = Mg + \frac{M \times V}{60 \times \Delta t}$$

M：Mass of moving object（kg）

g：Acceleration of gravity（9.8m/s²）

V：Velocity（m/min）

Δ t：Acceleration /deceleration time（s）

μ：Friction coefficient

Calculation for ball screws selection

Deviation can be corrected by estimating the temperature rise per extension of 0.016mm, and taking into consideration of the pre-tension of 458 kgf .

（b） Rigidity

（1） Directional rigidity

$$\delta_{SF} = \frac{PL}{4AE} = \frac{27 \times 1200}{4 \times \frac{\pi \times 35.2^2}{4} \times 2.06 \times 10^4}$$

$$= 0.00036 \text{ mm}$$

$$K_S = \frac{370}{0.00036} = 10.3 \times 10^5 \text{ kgf / mm}$$

（2） Rigidity of steel ball and nut groove

$$n = \frac{41.8 \times \pi \times 2.5}{6.35} = 52$$

$$Q = \frac{370}{52 \sin 45°} = 10$$

$$\delta_{NS} = \frac{0.00057}{\sin 45°} \left(\frac{10^2}{6.35} \right)^{1/3} \times \frac{1}{0.7}$$

$$= 2.9 \times 10^{-3} \text{mm}$$

$$K_N = \frac{370}{2.9 \times 10^{-3}} = 1.28 \times 10^5 \text{kgf/mm}$$

（3） Rigidity of bracing bearings

Where, nut rigidity 50 kgf / mm

$$\delta_B = \frac{370}{50 \times 2} = 3.7 \ \mu \text{m}$$

$$K_B = \frac{370}{0.0037} = 1 \times 10^5 \text{ kgf/mm}$$

◎ $\delta_{TOTAL} = 0.36 + 2.9 + 3.7 = 6.96 \ \mu \text{m}$

14．Confirmation of the ball screw life

14．Confirmation of the ball screw life

$$L = 20479(h) > 18000 (h)$$

5.1 Lubrication

Adequate lubrication must be provided when ball screw is used, insufficient lubrication will result in contact of metal, which in turn leads to increase of friction and friction loss, thus cause failure or shortening of service life.

Lubricants applied to ball screws can be divided into 2 types,namely lubricating oil and consistent grease. In general speaking, in respect of maintenance, consistent grease will lead to increase of dynamic friction torque linearly along with increase of rotating speed, hence oil lubrication is deemed the better way when speed exceeds 3-5 m/min; however, don't forget the fact that there have been examples that using grease has been capable of achieving speed of 10 m/min, with respect to the equipment.

Table 5.1 Inspection of lubrication and interval of refill

Method	Interval	Check Item	Replenish or Change Interval
Auto. Intermittent oil supply	Weekly	Oil level, contamination	Add at each check, as required depending on tank level
Grease	nitially 2-3 months	Contamination on entry of chip	Replenish yearly or according to the inspection results
Oil bath	Daily	Oil level	To be determined according to consumption

5.2 Contaminant Prevention

Any foreign matter or water, if allowed to enter the ball screw, may increase friction and cause damage.

For example, the entry of chips or cutting oil may be expected with machine tools depending on the work environment. Where entry of foreign matter is anticipated, use a bellows or telescopic cover as shown in Fig. 5.1, to cover the screw shaft completely.
Fig. 5.1 Dust proof Method by Telescopic Cover andBellows

5.3 Offset load

When offset load phenomenon occurs, screw life and noise tend to be directly affected, which would usually be accompanied with hand feel of rough running. In the event unload running and running right after assembling demonstrate different degree of cases, this should be ascribed to the poor assembly accuracy which will produce offset load phenomenon as shown in Fig. 5.2
Fig. 5.2 Offset load
